

# Why AMH Alone Isn't Always Enough

## Hormone Testing for Gonadal Remnants in Pets

Some vets rely solely on AMH to detect ovarian or testicular remnants...

Small ovarian remnant

Produces progesterone or oestradiol

False negative AMH result

While AMH alone is fine for neutered males, small remnants may suppress AMH or not produce it at all in spayed females

AMH indicates gonadal tissue, but can be suppressed or absent

Progesterone suggests luteal activity, especially post-ovulation

E2 is usually elevated in spayed females showing signs of oestrous

### RECOMMENDED PROTOCOL

- ✓ Measure AMH
- ✓ Measure Progesterone
- ✓ Measure E2

To ensure diagnostic accuracy in spayed females, it is recommended to measure all three hormones. A full hormone panel provides a clearer picture when ovarian remnants are suspected
